

DISASTER RECOVERY

Almost all organisations, from global corporations to small and medium enterprises, are reliant on sophisticated technology to deliver communications, commerce and customer facing services.

The need for Disaster Recovery and Business Continuity has never been greater. We live in an age where time is one of our most valuable commodities and organisations are now required to safeguard their effectiveness and productivity to retain their competitive position in the marketplace.

Do you have an IT Disaster Recovery Plan?

IcoSys provide a complete IT Disaster Recovery consultancy service, and can develop a detailed Disaster Recovery Plan that will help minimise the impact of any disaster that may befall your organisation.

Impact Analysis and Recovery Times

Different organisations are able to cope with events differently. A disaster to one organisation may be only an inconvenience to another. Equally, IT systems failure can be catastrophic for some organisations and will require immediate restoration. Others may be able to work around IT systems failure for a few days before its has a major impact.

Your Disaster Recovery Plan must take into account the impact any particular disaster can have on your business continuity and the urgency associated with full recovery. In other words, your Disaster Recovery Plan should have defined Service Levels.

Prevention

We will examine the possible risks to your organisation's IT systems, and balance that against the levels of resilience and fault tolerance required to offset these risks. Even the equipment used to provide your organisation with extra protection needs to be examined, as facilities beyond just your IT infrastructure can affect your recovery.

It is important to assess your current contingency plans and review any previous incidents. We will assess whether your current methods of protection are in accordance with the recently conducted Impact Analysis.

A recommendation report will outline steps that can be taken to reduce levels of risk and their consequential impact on business continuity.

Response

We will work with you to prepare a Disaster Recovery Plan that will detail Response and Recovery Procedures, aimed at bringing your systems and services back to full operation within the recently defined Service Levels.

Once the Disaster Recovery Plan has been drafted, it is essential that the Plan is tested to iron out any potential glitches before it is used in earnest.

The missing piece
in your IT strategy
